ECON 172 - Section 1 : Introduction to R

Roberto Rocha and Jed Silver

Spring 2021

1 Welcome to Econ 172 Section

Hi! We are your GSIs for Econ 172 this semester, Roberto and Jed. Our goal is to make these sections as interactive as possible. The more you and your classmates participate, the more everyone will get out of section. We will mainly focus on reviewing the econometric methods discussed in lecture and applying them using R.

Feel free to attend any of the sections led by the GSI of the section you enrolled in.

Roberto robertohsurocha@berkeley.edu

- Monday 2-3 PM (101)
- Tuesday 10-11 AM (102)
- Friday 9-10 AM (106)
- Office Hours: TBD

Jed jed_silver@berkeley.edu

- Wednesday 3-4 PM (103)
- Thursday 9-10 AM (104)
- Thursday 5-6 PM (105)
- Office Hours: Thursday 6-7 PM

All of the Zoom links for section are on bCourses. We will also post all materials on bCourses.

Please try to attend section regularly if you are in a time zone that allows you to do so and if not, please watch the recordings that we will post on bCourses. As in lecture, we'd appreciate if you keep your camera on for section, but understand that this may not always be possible for all students. We understand that things are still difficult this semester and we will try to be as accommodating as possible, so please communicate any issues to us and we will try our best to help.

Feel free to email with any questions you may have that can be answered over email, for example, administrative questions. Please include [ECON 172] in the subject line of any email communications. We will do do our best to respond to all emails within 48 hours, perhaps longer over weekends. For in-depth questions that will require a longer response, come by office hours instead. Often an in-person discussion can help clear things up more effectively than communication over email.

2 Welcome to R

R is a programming language and environment for statistical computing and graphics which is free to use and runs on Windows, Unix and MacOS. To do analysis in R, one can either write one's own commands or take advantage of the huge number of pre-existing packages written by R users and freely available. We are

not assuming any prior knowledge of R. If you are not familiar with programming, it can be a bit tricky at first but we are here to make sure you get the hang of it. R is used throughout the social sciences and in industry, so while this course will provide a basic overview, you may find it wortwhile to dive a bit deeper and really master it.

2.1 Getting Started

2.1.1 Using R on your local machine (optional)

R can be downloaded from https://cran.rstudio.com/. We also recommend downloading RStudio, a user interface which makes R easier to use. It can be downloaded from https://www.rstudio.com/products/rstudio/download/.

If you run R on your local computer, you will need to install any packages you want to use (just one time), then load them into R's library for the current session. After that, it's easy to access any of the commands in the package (which are also generally extensively documented in a sort of user guide for the package).

2.1.2 Using R on your UC Berkeley Datahub (recommended)

RStudio also runs on the UC Berkeley Datahub, so you don't need to install it locally on your computer. To start RStudio on Datahub, simply go to: https://r.datahub.berkeley.edu/

In our sections (and for the problem sets), we are going to show you this way of using RStudio. However, anything that we show you should also work on your local machine.

2.2 R Code

When we use R, we want to write and save our commands in a script. This will let us reproduce everything we do without having to retype our commands every time we work on a project. To do this, you can write and save a file as a .R file, which typically contains only code and code comments. You can find a separate .R file containing the code used to conduct the analysis below in the folder with the material for this section.

2.3 RMarkdown

What's even nicer about R is a file format called RMarkdown, such as the one you are currently working in. This file type allows you to combine text, mathematical equations (in a format called LaTeX), code as well as dynamic output from this code, and automatically compile / output everything into a pdf document. (In RMarkdown language, this process is called "knitting" the document.)

2.4 Setting up the Environment

First, we need to set up the R environment, including installing all the required packages, loading all the required packages. This is done using R-code. The way to let RMarkdown know that the following output is a 'code chunk' is by enclosing the code chunk in triple quotations, as below. The code chunk indicator is followed by curly brackets, and r (indicating this code chunk is in the R language), a name for the code chunk (here "setup"), and some additional parameters. The parameter "results='hide'" and "message=FALSE" lets RMarkdown know that we will not want to include the output of or any messages generated by this code chunk in the pdf document (but the code will still run).

In your code, you can add comments, using # (beginning of the line) and ## (end of the line). These comments are not run as code, but will help your later self (and others reading your code) to understand what you were doing.

```
knitr::opts_chunk$set(echo = TRUE) ## sets global option to include code chunks in-line
#install.packages("haven") ## only run once to install
library(haven) #this library allows you to load datasets in Stata format
#install.packages("tidyverse") ## only run once to install
```

```r
library(tidyverse)
#install.packages("summarytools") ## only run once to install
library(summarytools)
```

```
## Warning: package 'summarytools' was built under R version 4.0.3
```

```r
#install.packages("stargazer") ## only run once to install
library(stargazer) ##This package is great for making tables in .html, .tex and many other formats.
```

```
## Warning: package 'stargazer' was built under R version 4.0.3
```

```r
#install.packages("broom") ## only run once to install
library(broom)
```

The code chunk specifies that, by default, code chunks are part of the pdf output. Next, it installs a few packages. You only need to run this installation once. Afterwards, the package will remain installed on your datahub. (Remove the # before the install.packages commands to install each package for the first time, then "comment out" these lines using #, as above.) Next, the "library" command lets R know that you will want to use these packages in your code.

2.5 Loading Data

The first step in using R for statistical analysis is to store data in what R calls a "data frame," a matrix whose columns have different modes (like numeric, words, etc.) and each row is a unit of observation (i.e: a person or a country, etc.)

R can load data from many types of files, including .csv and .txt. R has its own type of data file, with a .rds or .Rdata extension, and can also load data from Stata, SPSS, and SAS (other statistics computing programs) with the appropriate commands. The .rds format allows for a single object to be saved at a time, like a single dataset. The .RData format allows for multiple objects to be saved at once. Either one is a great way to save your data in R format.

For this section, we will be using data from Robinson, Acemoglu and Johnson (2001). For your convenience, the following link imports this data directly into your Datahub repository: Datahub The folder should now appear as "ECON-172-Sp21" on your workspace (bottom right). Click on the folder, then "Section01" and then click on the .Rmd file to open the file that produced the PDF you're reading.

When we load a dataframe in R, we give it a name for reference, such as `mydata` or something more specific, like `prop_rights`. We also need to tell R where to find the data. We can do that by specifying a full file path to its exact location of the data. For the purposes of this section, we'll use the dataset `prop_right"` which is an example dataset that contains data on a property rights index (protection against expropriation risk), GDP per capita and other variables for countries that were European colonies in the past.

```r
## Load in data in csv form, from the folder just loaded into your directory.
## Important: Paths are always relative to the RMarkdown file location
##            Alternatively, specify your working directory using
##            knitr::opts_chunk$set(root.dir = "xxx")
prop_rights <- read.csv("prop_rights.csv")
```

Next we can visualize the database we just imported, and take a look at what variables are included. To do so, it's easiest to click directly on the dataset in your Environment pane on the top right in RStudio.

```r
## Let's take a look on the dataset.
prop_rights ## print the dataframe to screen
head(prop_rights) ## or print first few observations

## Let's take a look the variables in this dataset.
names(prop_rights) ## just print
```

```
prop_rights_variables <- names(prop_rights) ## store list, assigned "prop_rights_variables"
prop_rights_variables ## take a look at this list
```

3 Analysis in R

3.1 Summary Statistics

Once a dataframe is loaded in R, it's very easy to run basic summary statistics. Unlike many other statistics programs, R provides fairly minimal output, and it's possible to store the results of a command without ever displaying them. For example, we may be interested in summary statistics for the GDP per capita of countries in the sample, which we can get by typing {summary(prop_rights\$gdppc). This command instructs R to look in the dataframe listed before the $ symbol (in this case, `prop_rights`), and to summarize the variable that follows the $ symbol (in this case, `gdppc`). Note, the `results = 'markup'` bit tells RMarkdown to display the output of the code exactly as displayed in the R console.

```
## Let's look at some summary statistics.
## Here is the min, 25%-ile, median, mean, 75%-ile, and max for the variable gdppc
summary(prop_rights$gdppc) ## just print
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##     450    1480    2835    5445    6968   27330
```

```
prop_rights_sumstats <- summary(prop_rights$gdppc) ## store summary, "prop_rights_variables"
prop_rights_sumstats ## take a look at this summary
```

```
##    Min. 1st Qu.  Median    Mean 3rd Qu.    Max.
##     450    1480    2835    5445    6968   27330
```

Or, we may be interested specifically in the **mean** value of GDP per capita for countries in the sample specifically, which we can get by typing `mean(prop_rights\$gdppc)`. As before, this command instructs R to look in the `prop_rights` dataframe and calculate the mean for the variable `gdppc`. We can store value resulting from this calculation, by using the `<-` symbol to store the results in a new object called `meangdp`, which can be called by typing `meangdp` into the console, or used in another command or context later on.

```
## Let's look specifically at mean GDP
mean(prop_rights$gdppc) ## just print
```

```
## [1] 5445.458
```

```
meangdp <- mean(prop_rights$gdppc) ## save as a variable, called "meangdp"
meangdp ## take a look at the value stored in of "meangdp"
```

```
## [1] 5445.458
```

Similar commands exist for standard deviation (`sd`), variance (`var`), minimum (`min`), maximum (`max`), median (`med`), range (`range`) and quantile (`quantile`).

3.2 Regression

Linear regression is also very straightforward to apply in R. The lm command, which comes preloaded, can be used for univariate or multivariate regression:

$$Y_i = \alpha + \beta X_{1,i} + \gamma X_{2,i} + ... + e_i$$

(Note: The above mathematical expression was written in a typesetting environment called LaTeX, and can easily be included in RMarkdown. For examples, see the Script.) Examples of how to run a regression of log GDP per capita on protection against the property rights index (protection) and latitude are below:

```r
## Univariate regression of log gdp per capita on property rights index.
lm(logGDP ~ protection, data=prop_rights) # display regression results
```

```
##
## Call:
## lm(formula = logGDP ~ protection, data = prop_rights)
##
## Coefficients:
## (Intercept)    protection
##      4.6604        0.5221
```

```r
## Multivariate, adding absolute latitude.
lm(logGDP ~ protection + lat_abst, data=prop_rights) # display regression results
```

```
##
## Call:
## lm(formula = logGDP ~ protection + lat_abst, data = prop_rights)
##
## Coefficients:
## (Intercept)    protection      lat_abst
##      4.7281        0.4679        1.5769
```

```r
## Storing results
reg1 <- lm(logGDP ~ protection, data=prop_rights) # save results, assign to "reg1"
reg2 <- lm(logGDP ~ protection + lat_abst, data=prop_rights) # save results, assign to "reg2"
```

In the last example, we store the univariate regression results in the object reg1 and the multivariate regression results in the object reg2. If you try this in R, you'll notice the results don't display on the screen when you store the results, but you can access them by naming the object.

```r
## Now access regression results for the multivariate regression
summary(reg2) # access complete regression results
```

```
##
## Call:
## lm(formula = logGDP ~ protection + lat_abst, data = prop_rights)
##
## Residuals:
##     Min      1Q  Median      3Q     Max
## -1.6845 -0.4233  0.1408  0.4584  1.1858
##
## Coefficients:
##             Estimate Std. Error t value Pr(>|t|)
## (Intercept)  4.72808    0.39732  11.900  < 2e-16 ***
## protection   0.46789    0.06416   7.292 7.29e-10 ***
## lat_abst     1.57688    0.71031   2.220   0.0301 *
## ---
## Signif. codes:  0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' ' 1
##
## Residual standard error: 0.6917 on 61 degrees of freedom
## Multiple R-squared:  0.5745, Adjusted R-squared:  0.5605
## F-statistic: 41.18 on 2 and 61 DF,  p-value: 4.805e-12
```

3.3 Tables

There are many packages in R that let one create very nice tables. We recommend `stargazer`. Take the two regressions we ran, stored as `reg1` and `reg2`, and say we want to export both to a table to be used in word or LaTeX.

To include the final table in the knitted pdf created by RMarkdown, you can use the following template. (Note, we want to use `results='asis'` and `header=FALSE`, in order for RMarkdown to compile the LaTeX table into a pretty format when knitting the pdf):

```
stargazer(reg1, reg2,
          out="Table 1",type="latex",header=FALSE, table.placement = "!h",
          title="Property Rights and Development",align=TRUE,
          report = "vc*st", omit.stat=c("LL","ser","f","rsq","adj.rsq"),no.space=TRUE)
```

Table 1: Property Rights and Development

	Dependent variable:	
	logGDP	
	(1)	(2)
protection	0.522***	0.468***
	(0.061)	(0.064)
	$t = 8.533$	$t = 7.292$
lat_abst		1.577**
		(0.710)
		$t = 2.220$
Constant	4.660***	4.728***
	(0.409)	(0.397)
	$t = 11.408$	$t = 11.900$
Observations	64	64
Note:	*p<0.1; **p<0.05; ***p<0.01	

The above command combines regression output saved in reg1 and reg2 into one table. Stargazer lets you specify title, alignment of coefficients inside columns and rows, which statistics to report (here, the variable names `v`, coefficients `c`, significance stars `*`, standard errors `s` and t-statistics `t`). Moreover, you can tell it to omit statistics such as the log-likelihood `LL`, the R^2 `rsq`, etc. You can also set the table placement in the final pdf (here, `table.placement="H"` means that the table will be placed directly after the code chunk). Stargazer has extensive documentation (try `??stargazer` in R) and can also be used to make great summary statistics tables - try it out! Note that `type="latex"` produces table code that can be interpreted by LateX to produce nicely-formatted tables when you knit your RMarkdown file to PDF. Another alternative is to use the `type="text"` option to have a nicely formatted version of the table print to screen (for example, to later copy/paste into a word document).

3.4 Plotting

R also makes it easy to do basic plots. For example, one might want to create a scatterplot from two variables, and graph the regression line - or line of best fit - on the plot. This is easy to do with the plot command, which as a default plots the first variable listed on the horizontal axis, and the second on the vertical axis. Below we show a plot of the property rights index (protection against expropriation risk) and log of GDP per capita with titles and labels. We also use the `abline` command to add a regression line to the graph.

```
## A scatterplot with titles and line of best fit from univariate regression
plot(prop_rights$protection,prop_rights$logGDP,
```

```
     xlab="Protection against expropriation", ylab="Log (DP per capita)")
abline(reg1) # line of best fit using regression results as per "reg1"
```

4 Resources for further study

- UCLA has a number of excellent resources to help you learn more about how to use R, available at: http://www.ats.ucla.edu/stat/r/.

- You can also find interactive lessons at Try R http://tryr.codeschool.com/ for practice writing code.

- We also recommend the text on the syllabus, Hanck, Christoph, Martin Arnold, Alexander Gerber and Martin Schmelzer. (2018). Introduction to Econometrics with R, https://www.econometrics-with-r.org/.

- You may also find https://www.r-bloggers.com/ to be a useful resource for specific questions.

- Finally, we include two useful resources that summarize useful R commands and common RMarkdown features.

Base R
Cheat Sheet

Getting Help

Accessing the help files

`?mean`
Get help of a particular function.

`help.search('weighted mean')`
Search the help files for a word or phrase.

`help(package = 'dplyr')`
Find help for a package.

More about an object

`str(iris)`
Get a summary of an object's structure.

`class(iris)`
Find the class an object belongs to.

Using Libraries

`install.packages('dplyr')`
Download and install a package from CRAN.

`library(dplyr)`
Load the package into the session, making all its functions available to use.

`dplyr::select`
Use a particular function from a package.

`data(iris)`
Load a built-in dataset into the environment.

Working Directory

`getwd()`
Find the current working directory (where inputs are found and outputs are sent).

`setwd('C://file/path')`
Change the current working directory.

Use projects in RStudio to set the working directory to the folder you are working in.

Vectors

Creating Vectors

`c(2, 4, 6)`	2 4 6	Join elements into a vector
`2:6`	2 3 4 5 6	An integer sequence
`seq(2, 3, by=0.5)`	2.0 2.5 3.0	A complex sequence
`rep(1:2, times=3)`	1 2 1 2 1 2	Repeat a vector
`rep(1:2, each=3)`	1 1 1 2 2 2	Repeat elements of a vector

Vector Functions

`sort(x)`	`rev(x)`
Return x sorted.	Return x reversed.
`table(x)`	`unique(x)`
See counts of values.	See unique values.

Selecting Vector Elements

By Position

`x[4]`	The fourth element.
`x[-4]`	All but the fourth.
`x[2:4]`	Elements two to four.
`x[-(2:4)]`	All elements except two to four.
`x[c(1, 5)]`	Elements one and five.

By Value

`x[x == 10]`	Elements which are equal to 10.
`x[x < 0]`	All elements less than zero.
`x[x %in% c(1, 2, 5)]`	Elements in the set 1, 2, 5.

Named Vectors

`x['apple']`	Element with name 'apple'.

Programming

For Loop

```
for (variable in sequence){
    Do something
}
```

Example

```
for (i in 1:4){
    j <- i + 10
    print(j)
}
```

While Loop

```
while (condition){
    Do something
}
```

Example

```
while (i < 5){
    print(i)
    i <- i + 1
}
```

If Statements

```
if (condition){
    Do something
} else {
    Do something different
}
```

Example

```
if (i > 3){
    print('Yes')
} else {
    print('No')
}
```

Functions

```
function_name <- function(var){
    Do something
    return(new_variable)
}
```

Example

```
square <- function(x){
    squared <- x*x
    return(squared)
}
```

Reading and Writing Data

Input	Ouput	Description
`df <- read.table('file.txt')`	`write.table(df, 'file.txt')`	Read and write a delimited text file.
`df <- read.csv('file.csv')`	`write.csv(df, 'file.csv')`	Read and write a comma separated value file. This is a special case of read.table/write.table.
`load('file.RData')`	`save(df, file = 'file.Rdata')`	Read and write an R data file, a file type special for R.

Conditions

`a == b`	Are equal	`a > b`	Greater than	`a >= b`	Greater than or equal to
`a != b`	Not equal	`a < b`	Less than	`a <= b`	Less than or equal to
		`is.na(a)`	Is missing		
		`is.null(a)`	Is null		

Types

Converting between common data types in R. Can always go from a higher value in the table to a lower value.

as.logical	TRUE, FALSE, TRUE	Boolean values (TRUE or FALSE).
as.numeric	1, 0, 1	Integers or floating point numbers.
as.character	'1', '0', '1'	Character strings. Generally preferred to factors.
as.factor	'1', '0', '1', levels: '1', '0'	Character strings with preset levels. Needed for some statistical models.

Maths Functions

log(x)	Natural log.	sum(x)	Sum.
exp(x)	Exponential.	mean(x)	Mean.
max(x)	Largest element.	median(x)	Median.
min(x)	Smallest element.	quantile(x)	Percentage quantiles.
round(x, n)	Round to n decimal places.	rank(x)	Rank of elements.
signif(x, n)	Round to n significant figures.	var(x)	The variance.
cor(x, y)	Correlation.	sd(x)	The standard deviation.

Variable Assignment

```
> a <- 'apple'
> a
[1] 'apple'
```

The Environment

ls()	List all variables in the environment.
rm(x)	Remove x from the environment.
rm(list = ls())	Remove all variables from the environment.

You can use the environment panel in RStudio to browse variables in your environment.

Matrixes

```
m <- matrix(x, nrow = 3, ncol = 3)
```
Create a matrix from x.

```
t(m)
```
Transpose

```
m %*% n
```
Matrix Multiplication

```
solve(m, n)
```
Find x in: m * x = n

```
m[2, ]
```
- Select a row

```
m[ , 1]
```
- Select a column

```
m[2, 3]
```
- Select an element

Lists

```
l <- list(x = 1:5, y = c('a', 'b'))
```
A list is collection of elements which can be of different types.

l[[2]]	l[1]	l$x	l['y']
Second element of l.	New list with only the first element.	Element named x.	New list with only element named y.

Data Frames

Also see the **dplyr** library.

```
df <- data.frame(x = 1:3, y = c('a', 'b', 'c'))
```
A special case of a list where all elements are the same length.

x	y
1	a
2	b
3	c

List subsetting

```
df$x          df[[2]]
```

Understanding a data frame

View(df)	See the full data frame.
head(df)	See the first 6 rows.

Matrix subsetting

```
df[ , 2]
df[2, ]
df[2, 2]
```

nrow(df)	Number of rows.
ncol(df)	Number of columns.
dim(df)	Number of columns and rows.

cbind - Bind columns.

rbind - Bind rows.

Strings

```
paste(x, y, sep = ' ')
```
Join multiple vectors together.

```
paste(x, collapse = ' ')
```
Join elements of a vector together.

```
grep(pattern, x)
```
Find regular expression matches in x.

```
gsub(pattern, replace, x)
```
Replace matches in x with a string.

```
toupper(x)
```
Convert to uppercase.

```
tolower(x)
```
Convert to lowercase.

```
nchar(x)
```
Number of characters in a string.

Factors

```
factor(x)
```
Turn a vector into a factor. Can set the levels of the factor and the order.

```
cut(x, breaks = 4)
```
Turn a numeric vector into a factor but 'cutting' into sections.

Statistics

```
lm(x ~ y, data=df)
```
Linear model.

```
glm(x ~ y, data=df)
```
Generalised linear model.

```
summary
```
Get more detailed information out a model.

```
t.test(x, y)
```
Preform a t-test for difference between means.

```
pairwise.t.test
```
Preform a t-test for paired data.

```
prop.test
```
Test for a difference between proportions.

```
aov
```
Analysis of variance.

Distributions

	Random Variates	Density Function	Cumulative Distribution	Quantile
Normal	rnorm	dnorm	pnorm	qnorm
Poison	rpois	dpois	ppois	qpois
Binomial	rbinom	dbinom	pbinom	qbinom
Uniform	runif	dunif	punif	qunif

Plotting

plot(x)	Values of x in order.
plot(x, y)	Values of x against y.
hist(x)	Histogram of x.

Dates

See the **lubridate** library.

R Markdown Cheat Sheet

learn more at rmarkdown.rstudio.com

Studio

Dynamic Documents

You can choose to export the finished report as a html, pdf, MS Word, ODT, RTF, or markdown document; or as a html or pdf based slide show.

Reproducible Research

At the click of a button, or the type of a command, you can rerun the code in an R Markdown file to reproduce your work and export the results as a finished report.

.Rmd files

An R Markdown (.Rmd) file is a record of your research. It contains the code that a scientist needs to reproduce your work along with the narration that a reader needs to understand your work.

Workflow

1 Open a new .Rmd file at File ▸ New File ▸ R Markdown. Use the wizard that opens to pre-populate the file with a template

2 Write document by editing template

3 Knit document to create report Use knit button or **render()** to knit

4 Preview Output in IDE window

5 Publish (optional) to web or server
Synch publish button to accounts at
- rpubs.com,
- shinyapps.io
- RStudio Connect
Reload document
Find in document
File path to output document

6 Examine build log in R Markdown console

7 Use output file that is saved alongside .Rmd

```

R Markdown

RStudio
- R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents.

```
summary(cars)
##     speed           dist
## Min.   : 4.0   Min.   :  2.00
## 1st Qu.:12.0   1st Qu.: 26.00
## Median :15.0   Median : 36.00
## Mean   :15.4   Mean   : 42.98
## 3rd Qu.:19.0   3rd Qu.: 56.00
## Max.   :25.0   Max.   :120.00
```

For more details on using R Markdown see http://rmarkdown.rstudio.com.

.Rmd structure

YAML Header
Optional section of render (e.g. pandoc) options written as key:value pairs (YAML).
- At start of file
- Between lines of - - -

Text
Narration formatted with markdown, mixed with:

Code chunks
Chunks of embedded code. Each chunk:
- Begins with ```{r}
- ends with ```

R Markdown will run the code and append the results to the doc.

It will use the location of the .Rmd file as the **working directory**

render()

Use rmarkdown::**render()** to render/knit at cmd line. Important args:

input - file to render
output_format
output_options - List of render options (as in YAML)
output_file
output_dir
params - list of params to use
envir - environment to evaluate code chunks in
encoding - of input file

Interactive Documents

Turn your report into an interactive Shiny document in 4 steps

1 Add runtime: shiny to the YAML header.

2 Call Shiny input functions to embed input objects.

3 Call Shiny render functions to embed reactive output.

4 Render with rmarkdown::**run** or click **Run Document** in RStudio IDE

```
---
output: html_document
runtime: shiny
---

```{r, echo = FALSE}
numericInput("n",
  "How many cars?", 5)

renderTable({
  head(cars, input$n)
})
```
```

Embed a complete app into your document with shiny::shinyAppDir()

Your report will rendered as a Shiny app, which means you must choose an html output format, like html_document, and serve it with an active R Session.

Embed code with knitr syntax

Inline code
Insert with `r <code>`. Results appear as text without code.

```
Built with
`r getRversion()`
```
→ Built with 3.2.3

Important chunk options

cache - cache results for future knits (default = FALSE)
cache.path - directory to save cached results in (default = "cache/")
child - file(s) to knit and then include (default = NULL)
collapse - collapse all output into single block (default = FALSE)
comment - prefix for each line of results (default = "##")

Code chunks
One or more lines surrounded with ```{r} and ```. Place chunk options within curly braces, after **r**. Insert with

```
```{r echo=TRUE}
getRversion()
```
```
→
```
getRversion()
[1] '3.2.3'
```

dependson - chunk dependencies for caching (default = NULL)
echo - Display code in output document (default = TRUE)
engine - code language used in chunk (default = 'R')
error - Display error messages in doc (TRUE) or stop render when errors occur (FALSE) (default = FALSE)
eval - Run code in chunk (default = TRUE)

fig.align - 'left', 'right', or 'center' (default = 'default')
fig.cap - figure caption as character string (default = NULL)
fig.height, fig.width - Dimensions of plots in inches
highlight - highlight source code (default = TRUE)
include - Include chunk in doc after running (default = TRUE)

Global options
Set with knitr::opts_chunk$set(), e.g.

```
```{r include=FALSE}
knitr::opts_chunk$set(echo = TRUE)
```
```

message - display code messages in document (default = TRUE)
results (default = 'markup')
  'asis' - passthrough results
  'hide' - do not display results
  'hold' - put all results below all code
tidy - tidy code for display (default = FALSE)
warning - display code warnings in document (default = TRUE)

Options not listed above: R.options, aniopts, autodep, background, cache.comments, cache.lazy, cache.rebuild, cache.vars, dev, dev.args, dpi, engine.opts, engine.path, fig.asp, fig.env, fig.ext, fig.keep, fig.lp, fig.path, fig.pos, fig.process, fig.retina, fig.scap, fig.show, fig.showtext, fig.subcap, interval, out.extra, out.height, out.width, prompt, purl, ref.label, render, size, split, tidy.opts

Parameters

Parameterize your documents to reuse with different inputs (e.g., data sets, values, etc.)

1 Add parameters Create and set parameters in the header as sub-values of **params**

2 Call parameters Call parameter values in code as **params$<name>**

3 Set parameters Set values with **Knit with parameters** or the params argument of render():

```
render("doc.Rmd",
params = list(n = 1, d = as.Date("2015-01-01"))
```

```
---
params:
  n: 100
  d: !r Sys.Date()
---
```
Indent 2 spaces

Today's date is `r params$d`

Knit HTML
Knit to HTML
Knit to PDF
Knit to Word
Knit with Parameters...

How many cars?
5

	speed	dist
1	4.00	2.00
2	4.00	10.00
3	7.00	4.00
4	7.00	22.00
5	8.00	16.00

Pandoc's Markdown

Write with syntax on the left to create effect on right (after render)

Syntax	Effect
Plain text	Plain text
End a line with two spaces to start a new paragraph.	End a line with two spaces to start a new paragraph.
italics and **bold**	*italics* and **bold**
`verbatim code`	`verbatim code`
sub/superscript^2^~2~	sub/superscript$^2_2$
~~strikethrough~~	~~strikethrough~~
escaped: * _ \\	escaped: * _ \
endash: --, emdash: ---	endash: –, emdash: —
equation: $A = \pi*r^{2}$	equation: $A = \pi * r^2$
equation block:	equation block:
$$E = mc^{2}$$	$E = mc^2$
> block quote	block quote
# Header1 {#anchor}	**Header1**

Set render options with YAML

When you render, R Markdown
1. runs the R code, embeds results and text into .md file with knitr
2. then converts the .md file into the finished format with pandoc

.Rmd → knitr → md → pandoc →

Set a document's default output format in the YAML header:

```
---
output: html_document
---
# Body
```

output value — creates

output value	creates
html_document	html
pdf_document	pdf (requires Tex)
word_document	Microsoft Word (.docx)
odt_document	OpenDocument Text
rtf_document	Rich Text Format
md_document	Markdown
github_document	Github compatible markdown
ioslides_presentation	ioslides HTML slides
slidy_presentation	slidy HTML slides
beamer_presentation	Beamer pdf slides (requires Tex)

Customize output with sub-options (listed at right):

```
---
output:
  html_document:
    code_folding: hide
    toc_float: TRUE
---
# Body
```

html tabsets

Use .tabset css class to place sub-headers into tabs

```
# Tabset {.tabset .tabset-fade .tabset-pills}
## Tab 1
text 1
## Tab 2
text 2
### End tabset
```

Tabset

Tab 1 | Tab 2

text 1

End tabset

Set render options with YAML table

sub-option	description	html	pdf	word	odt	rtf	md	github	ioslides	slidy	beamer
citation_package	The LaTeX package to process citations, natbib, biblatex or none	X	X								
code_folding	Let readers to toggle the display of R code, "none", "hide", or "show"	X									
colortheme	Beamer color theme to use										X
css	CSS file to use to style document	X									
dev	Graphics device to use for figure output (e.g. "png")	X	X						X	X	
duration	Add a countdown timer (in minutes) to footer of slides									X	
fig_caption	Should figures be rendered with captions?	X	X	X	X	X	X	X	X	X	X
fig_height, fig_width	Default figure height and width (in inches) for document	X	X	X	X	X	X	X	X	X	X
highlight	Syntax highlighting: "tango", "pygments", "kate", "zenburn", "textmate"	X	X	X		X	X	X	X	X	X
includes	File of content to place in document (in_header, before_body, after_body)	X	X	X	X	X	X	X	X	X	X
incremental	Should bullets appear one at a time (on presenter mouse clicks)?								X	X	X
keep_md	Save a copy of .md file that contains knitr output	X	X	X		X	X	X	X	X	X
keep_tex	Save a copy of .tex file that contains knitr output		X								X
latex_engine	Engine to render latex, "pdflatex", "xelatex", or "lualatex"		X								X
lib_dir	Directory of dependency files to use (Bootstrap, MathJax, etc.)	X							X	X	
mathjax	Set to local or a URL to use a local/URL version of MathJax to render	X							X	X	
md_extensions	Markdown extensions to add to default definition or R Markdown	X	X	X	X	X	X	X	X	X	X
number_sections	Add section numbering to headers	X	X								
pandoc_args	Additional arguments to pass to Pandoc	X	X	X	X	X	X	X	X	X	X
preserve_yaml	Preserve YAML front matter in final document?						X				
reference_docx	docx file whose styles should be copied when producing docx output			X							
self_contained	Embed dependencies into the doc	X							X		X
slide_level	The lowest heading level that defines individual slides										X
smaller	Use the smaller font size in the presentation?								X		
smart	Convert straight quotes to curly, dashes to em-dashes,... to ellipses, etc.	X	X	X	X	X			X	X	
template	Pandoc template to use when rendering file	X								X	
theme	Bootswatch or Beamer theme to use for page	X								X	
toc	Add a table of contents at start of document	X	X	X	X	X	X	X		X	X
toc_depth	The lowest level of headings to add to table of contents	X	X	X	X	X	X	X		X	X
toc_float	Float the table of contents to the left of the main content	X									

Options not listed: extra_dependencies, fig_crop, fig_retina, font_adjustment, font_theme, footer, logo, html_preview, reference_odt, transition, variant, widescreen

---

Table suggestions

Several functions format R data into tables

Table with kable:
eruptions	waiting
3.600	79
1.800	54
3.333	74
2.283	62

```
```{r results = 'asis'}
knitr::kable(data, caption = "Table with kable")
```
```

Table with stargazer:
	eruptions	waiting
1	3.600	79.00
2	1.80	54.00
3	3.33	74.00
4	2.28	62.00

`data <- faithful[1:4,]`

Table with xtable:
	eruptions	waiting
1	3.600	79
2	1.800	54
3	3.333	74
4	2.283	62

```
```{r results = 'asis'}
print(xtable::xtable(data, caption = "Table with xtable"),
  type = "html", html.table.attributes = "border=0")
```
```

```
```{r results = 'asis'}
stargazer::stargazer(data, type = "html",
  title = "Table with stargazer")
```
```

Learn more in the **stargazer**, **xtable**, and **knitr** packages.

Create a Reusable template

1 Create a new package with a
inst/rmarkdown/templates directory

2 In the directory, Place a folder that contains:
- **template.yaml** (see below)
- **skeleton.Rmd** (contents of the template)
- any supporting files

3 Install the package

4 Access template in wizard at File ▶ New File ▶ R Markdown

template.yaml
```
---
name: My Template
---
```

Citations and Bibliographies

Create citations with .bib, .bibtex, .copac, .enl, .json, .medline, .mods, .ris, .wos, and .xml files

1 **Set bibliography file** and CSL 1.0 Style file (optional) in the YAML header
```
---
bibliography: refs.bib
csl: style.csl
---
```

2 **Use citation keys in text**
```
Smith cited [@smith04].
Smith cited without author [-@smith04].
@smith04 cited in line.
```

3 **Render.** Bibliography will be added to end of document
Smith cited (Joe Smith 2004).
Smith cited without author (2004).
Joe Smith (2004) cited in line.
